Digital Literacy Project — Consolidated Report

Abhijeet Wadnere | 25BAI11429

Overview

This project explored the multidimensional concept of digital literacy — spanning technical skills, cybersecurity awareness, professional online presence, and responsible digital communication — through five interconnected tasks.

Task 1 – Digital Literacy Infographic

Using Canva, I designed an infographic titled *"Digital Literacy Demystified"* that visually organized digital literacy into three core pillars: Critical Thinking & Evaluation, Technical Skills & Fluency, and Creative Production & Expression. The infographic highlighted practical student tools across productivity, research, communication, and design categories, while emphasizing cybersecurity principles such as Multi-Factor Authentication (MFA), link verification, and privacy auditing. A key takeaway was the *"Front Page Test"* — a reminder that everything posted online carries a permanent digital footprint.

Task 2 – Professional Platform Strategy

I established a purposeful presence across three platforms. GitHub (BobbyRoy360) serves as my public code portfolio, currently hosting repositories including a discrete mathematics Python collection. LinkedIn documents my

academic credentials at VIT Bhopal and my skills in Python. Kaggle marks the beginning of my journey into data science competitions. My four-year roadmap targets consistent GitHub contributions, advancing to a ranked Kaggle contributor, and leveraging LinkedIn for internship and career positioning by 2029.

Task 3 – Python Fundamentals & Digital Awareness Quiz

On CodeChef, I practiced foundational Python concepts, working through problems involving arithmetic operations and the print() function. Alongside this, I completed a *Digital Literacy Awareness Quiz* on Google Forms, which tested my ability to identify threats such as phishing attempts — specifically recognizing suspicious sender addresses and urgency-based manipulation tactics.

Task 4 – Professional Communication

I drafted two professional emails: one requesting an assignment extension from a professor, and another expressing interest in a summer internship. I also created a *Social Media Do's and Don'ts Checklist* covering best practices such as auditing privacy settings, verifying information before sharing, networking purposefully, and avoiding impulsive public posts that could damage academic or professional reputation.

Task 5 – Cybersecurity Case Study & Prevention Checklist

I analyzed the 2024 CDK Global ransomware attack, in which the BlackSuit group used compromised credentials to encrypt systems across 15,000+ dealerships, causing an estimated $1 billion in losses. This highlighted the danger of "double extortion" and single points of failure in B2B infrastructure. My *Stay Safe Online Checklist* addressed UPI/financial scam prevention, two-factor authentication, secure browsing, and the importance of reporting cyber fraud through the national helpline (1930) within the critical "Golden Hour."

Conclusion

This project transformed abstract digital literacy concepts into practical, applied skills — from writing professional emails and building a developer portfolio to identifying ransomware lifecycles and protecting personal financial data. These competencies form an essential foundation for my growth as a future AI/ML engineer.
